Background

 Traditional medicine has been developed in an effort to maintain health and treat disease disorders. One of them is temu putih (*Curcuma zedoaria*) rhizome extract which has antibacterial activity. The use of extract has problem during storage, namely that it is easily damaged by enzymatic processes..

Fig 1. Curcuma zedoaria Roscoe and Rhizomes

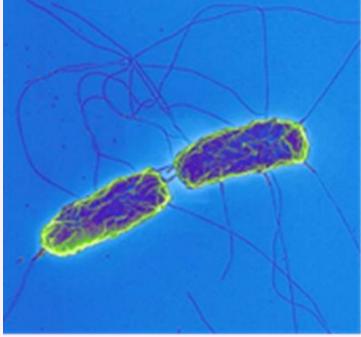

PURPOSE

• The purpose of this study was to compare the antibacterial activity of Curcuma zedoaria **Roscoe (CZR) rhizomes extract which were** irradiated with gamma rays and without irradiated against Salmonella typhi and Escherichia coli. CZR rhizome extract was irradiated with gamma rays at a dose of 0 kGy, 5 kGy, and 10 kGy, then stored until 3 months

Co-60 Gamma Ray Irradiation

Irradiation technology (radiation process) is a part of nuclear technology that has developed quite rapidly over the last four decades. Some of these radiation processes have been widely used in various industrial fields and for the preservation of agricultural products, including spices with labels on products with the symbol RADURA.

METHODS

CZR extract was dissolved in 70% ethanol and dried with a vacuum evaporator, as a comparison were used antibiotics, namely: chloramphenicol and amoxicillin. To find out, whether there were change in the chemical compounds content of the CZR rhizome extraxt due to the effects of irradiation (0 kGy, 5 kGy and 10 kGy), it had been observed the content of the chemical compounds alkaloids, flavonoids, tannins, and saponins. Antimicrobial activity test was carried out by observation of the Inhibitory Zone Diameter by the diffusion method and observation of the MIC by the dilution method.

RESULT

Table 1 The Result of Yields

No.	Storage Time	Doses	Initial Powder Weight	Condensed Extracts weights	Yields
1.	0 Bulan	0 kGy	200 g	40,2 g	20,10 %
		5 kGy	200 g	43,9 g	21,95 %
		10 kGy	200 g	47,3 g	23,68 %
2.	3 Bulan	0 kGy	200 g	40,7 g	20,35 %
		5 kGy	200 g	44,5 g	22,25 %
		10 kGy	200 g	47,8 g	23,90 %

Conclusion

- 1. The ethanol extract of *Curcuma zedoaria* rhizome irradiated (5 kGy and 10 kGy) and without irradiated (0 kGy) had antibacterial activities against *Salmonella typhi* and *Escherichia coli*. The higher the extract concentration the higher the antibacterial activities.
- 2. The treatment for 0 kGy, 5 kGy and 10 kGy of extracts storage period for 0 month and 3 months did not affect the antibacterial activities of the extracts.
- 3. The results of the identification of chemical constituents extract irradiated and the non-irradiated extract was not different
- 4. The diameter of inhibition zone of the extract at a concentration of 25% against Salmonella typhi without irradiated and irradiated at doses of 5 kGy and 10 kGy were average of 14 mm. The same results were obtained for chloramphenicol at a concentration of 25 μ g / ml. While the diameter inhibition zone of the extract at a concentration of 25% against Escherichia coli without irradiated and irradiated at doses of 5 kGy and 10 kGy were obtained for amoxicillin at a concentration of 25% against Escherichia coli without irradiated and irradiated at doses of 5 kGy and 10 kGy were average of 15 mm. The same results were obtained for amoxicillin at a concentration of 25 μ g / ml. While, at the Minimum Bactericidal Concentration (MBC) showed no colony growth in both bacteria at all, at irradiated doses and without irradiated either in the 0 month or 3 month storage period, namely at an extract concentration of 30%.
- 5. For a storage period of 3 months, it was found that there was bacterial growth in the extract that was not irradiated
